Adam Miller

Staff Software Engineer, Product & Growth Engineering

acm6603@gmail.com • LinkedIn • adammiller.co • Pittsburgh, PA (remote)

PROFESSIONAL SUMMARY

Product-minded full-stack engineer with nearly 20 years of building web products and the platforms that other teams use to ship them. At Walmart I was principal engineer and technical lead for a 50-engineer org, where I designed the server-rendered React architecture behind SamsClub.com, which drives millions of dollars in daily revenue. At Netflix I built a greenfield data-quality product that made Data Admins an order of magnitude more efficient, ran a customer program that earned the highest satisfaction scores of any Netflix platform team, and built tooling every JavaScript team at Netflix relies on. Most recently I led teams in the JS Platform org, serving 1,000+ engineers, and drove the org's shift to agentic development. I like ambiguous problems with a clear business number at the end of them.

PROFESSIONAL EXPERIENCE

Netflix

July 2021 – October 2026

Engineering Manager, JS Platform ***February 2026 – October 2026***

Managed two teams in succession (6, then 5 engineers) in the JS Platform org serving 1,000+ engineers, 900+ applications, and supporting ~40,000 merged PRs per week.

- Set long-term direction with the Jetpack Northstar foundation (guiding principles, strategy bets), aligning three platform teams and partners in Delivery, Source Control and Tech Catalog.
- Led the platform's shift to agentic development, shipping tooling to all 1,000+ engineers: parallel headless remote dev servers for agents working in separate git worktrees, agent-friendly CLIs, and llm-context in 100% of platform libraries, kept current by a CI-triggered agent.
- Created and led the Generative UI Working Group, evaluating MCP Apps, WebMCP and CopilotKit for agent-driven interfaces.
- Grew engineers, including converting an intern to full-time and preparing two engineers for promotion. Led teams through a reorg with no disruption to in-flight projects or career growth goals.

Senior Software Engineer, JS Platform ***May 2023 – January 2026***

- Created and led a monthly customer program with product engineering teams, turning their feedback into roadmap features and earning the highest customer satisfaction scores of any platform team at Netflix.
- Built an automated dependency-upgrade CLI with codemods that migrated the JS application fleet across breaking changes in design system and browser runtime libraries, cutting large-app migrations from weeks to days and saving thousands of engineering hours.
- Designed and shipped Netflix's paved path for JavaScript library versioning and publishing from scratch, closing a years-long gap in the platform.
- Built GraphQL introspection and codegen tooling with end-to-end type-safe requests across Netflix's federated graph, standardizing data fetching for JS clients.
- Core maintainer of Hawkins Professional, Netflix's internal design system.

Senior Software Engineer, Studio Foundations ***July 2021 – April 2023***

- Built Data Mechanic, a greenfield data-quality product that replaced a spreadsheet process spread across three apps with one guided deduplication workflow, making Data Admins an order of magnitude more efficient across Netflix's talent, vendor and production data.
- Designed a novel interface that shows how similar records connect in a graph database, so users could see why records matched and resolve duplicates in one place.
- Built embeddable data-entry and validation components used across Studio production tools.

Walmart eCommerce

February 2016 – July 2021

Principal Software Engineer, SamsClub.com

- Designed the UI architecture for SamsClub.com's server-rendered React app, which drives millions of dollars in daily revenue.
- Revamped cart, search, product details, and add-to-cart buttons, validating each change with A/B tests and gradual rollouts, lifting conversion 1–3% per change.
- Technical lead for a 50-engineer org, owning code quality, documentation and developer productivity.
- Drove test coverage across the SamsClub.com React codebase from ~13% to 92% with coverage thresholds in every repo and a team-wide practice of testing new functionality.

Earlier Experience

2007 – 2016

- **Saturday Morning Projects**, Founder (2009–2016): consulting, full-stack product builds and launches for startups, nonprofits and agencies.
- **The Barbarian Group**, Senior Design Technologist and Developer (2007–2013): led builds for GE, Mozilla and Red Bull.
- **Wikimedia Foundation**, UI Software Engineer (2009–2010): Usability Initiative features still live on Wikipedia.

SKILLS

Stack: TypeScript, React (SSR), Node.js, GraphQL

Product: customer research and feedback programs, onboarding and workflow design, design systems, A/B testing

Platform: Turborepo, CI/CD (GitHub Actions, Jenkins, Spinnaker), codemods, CLI tooling, GraphQL federation, on-call

AI: agent-native workflows, MCP, AI-assisted development in daily work

Leadership: technical strategy, cross-team alignment, mentoring, hiring

EDUCATION

Bachelor of Science, New Media
Rochester Institute of Technology
