# Adam Miller

Staff Software Engineer, Platform & Internal Tools

acm6603@gmail.com • LinkedIn • adammiller.co • Pittsburgh, PA (remote)

## PROFESSIONAL SUMMARY

Hands-on platform engineer with nearly 20 years of building tools other people depend on, from internal applications for demanding operational users to developer platforms for 1,000+ engineers. At Netflix I built Data Mechanic, a deduplication hub that made Studio Data Admins an order of magnitude more productive, ran a customer program that earned the highest satisfaction scores of any Netflix platform team, and most recently led two JS Platform teams through the shift to agentic development.

## PROFESSIONAL EXPERIENCE

### Netflix

*July 2021 – October 2026*

**Engineering Manager, JS Platform** ***February 2026 – October 2026***

Managed two teams in succession within the JS Platform org (1,000+ engineers, 900 projects, ~40,000 PRs merged per week across the fleet): UI Developer Experience (6 engineers, Feb-Aug), then JavaScript Application Platform (5 engineers, Aug-Oct), owner of Jetpack, Netflix's managed platform for developing and deploying JavaScript applications, and NodeQuark, its managed Node.js server runtime.

- Led the platform's shift to agentic development, with tooling available to all 1,000+ engineers:
  - Headless remote dev servers that run in parallel so multiple agents can work in separate git worktrees.
  - Every platform CLI refactored so embedded prompts became flags with help text, letting agents use them without guidance.
  - llm-context embedded in 100% of platform-provided libraries, kept current by an agent triggered from CI as the underlying libraries change.
- Equipped Netflix's sandboxed agentic runtime with this tooling, enabling it to deliver verified code changes to JavaScript applications.
- Created and led the Generative UI Working Group (50+ attendees per meeting across engineering, design and product), evaluating MCP Apps, WebMCP and CopilotKit for agent-driven internal and operational UIs.
- Shared on-call for Jetpack and NodeQuark, responding to production incidents on the platforms that build, deploy and run Netflix's JavaScript applications.
- Grew engineers (an intern converted to full-time who was soon building GraphQL migration tooling across ~150 repos; two engineers prepared for promotion), led a team through a reorg, and mentored two engineering teams in Warsaw.

**Senior Software Engineer, JS Platform** ***May 2023 – January 2026***

- Built an automated dependency-upgrade CLI with codemods that migrated the JS application fleet across breaking changes in design system and browser runtime libraries, cutting down the time required for large applications to migrate from weeks to days and saving thousands of engineering hours.
- Designed and shipped Netflix's paved-path tooling for JavaScript library versioning and publishing, closing a years-long gap in the platform's offerings.
- Created and led a monthly customer program with product engineering teams, turning their feedback into platform roadmap features and earning the highest customer satisfaction scores of any platform team at Netflix.
- Built GraphQL introspection and codegen tooling that standardized data fetching for JS clients, with end-to-end type-safe requests across Netflix's federated graph, one of the industry's largest.
- Core maintainer of Hawkins Professional, Netflix's internal design system.

**Senior Software Engineer, Studio Foundations** *July 2021 – April 2023*

- Built Data Mechanic, Studio's data-quality hub: replaced a spreadsheet-based process that had Data Admins jumping between three apps with one deduplication workflow powered by algorithmic matching and a graph database.
- Designed and built its core interface, a novel UI that lays graph relationships out in a 2D table with rich side-by-side record comparison, so Data Admins could see how possible duplicates connect and act on them in one place.
- Overhauled how Studio Data Admins worked, making them an order of magnitude more productive as measured by possible duplicate records resolved across Netflix's talent, vendor and production data.
- Partnered with Data Admins, design and product to shape the workflow, plus embeddable data-entry and validation components used across Studio production tools.

### Walmart eCommerce

*February 2016 – July 2021*

*Principal Software Engineer, SamsClub.com*

- Technical lead for a 50-engineer org, owning code quality, documentation and developer productivity.
- Designed the UI architecture for SamsClub.com's server-rendered React app, which drives millions of dollars in daily revenue.
- Drove test coverage across the SamsClub.com React codebase from ~13% to 92%: added coverage reporting and thresholds to every repo and established a team-wide practice of requiring tests for new functionality, which other engineers extended by retrofitting unit tests for key existing code.
- Ensured SamsClub.com's session replay and logging tools did not capture customers' personal data.

### Earlier Experience

*2007 – 2016*

- **Saturday Morning Projects**, Founder (2009–2016): consulting, full-stack builds and deployment for startups, nonprofits and agencies, alongside the roles around it.
- **The Barbarian Group**, Senior Design Technologist and Developer (2007–2013): led builds for GE, Mozilla and Red Bull.
- **Wikimedia Foundation**, UI Software Engineer (2009–2010): Usability Initiative features still live on Wikipedia.

## SKILLS

**Stack:** TypeScript, React, Node.js

**Platform:** Turborepo, CI/CD (Jenkins, GitHub Actions, Spinnaker), dependency management, CLI/TUI tooling, codemods (TS, CSS, GraphQL), design systems, GraphQL federation, on-call and incident response

**Backend & data:** Postgres, Elasticsearch, graph databases, KVDAL (Netflix's key-value data abstraction), GraphQL API design

**AI tooling:** MCP, agent-native developer workflows, agent plugins

**Leadership:** technical strategy, cross-functional alignment, customer programs, mentoring, hiring

## EDUCATION

**Bachelor of Science, New Media**
Rochester Institute of Technology
